AI Output Verification Worksheet

5 points to assess the reliability of an output

1/ ☐ IDENTIFY

Extract the important factual claims from the AI response. If the subject falls outside your expertise, treat the claims as unverified until you check them.

2/ ☐ **TRACE**

Identify the sources or evidence supporting each claim. Request the model to provide references. Check that the references exist and actually support the claims.

3/ ☐ **CROSS-CHECK**

Compare important claims against independent, credible sources. Books, newspapers or a simple internet search can provide insights.

4/ ☐ **CHALLENGE**

Look for contradictions, missing context, and unsupported certainty. Ask the model what the idea's weaknesses would be if you're trying to form an interpretation or opinion.

5/ ☐ **DECIDE**

Accept, revise, investigate further, or reject the output. Is something off? You may need to revisit the content or the information obtained. Iterate with any insights you have previously confirmed.
